**Overview**

AS-Interface is an open, international standard according to EN 50295 and IEC 62026-2 for process and field communication. Leading manufacturers of actuators and sensors all over the world support the AS-Interface. Interested companies are provided with the electrical and mechanical specifications by the AS-Interface Association.

AS-Interface is a single master system. For automation systems from Siemens, there are communications processors (CPs) communications modules (CMs) and routers (links) that control the process or field communication as masters, and actuators and sensors that are activated as AS-Interface slaves.

**Benefits**

A key feature of AS-Interface technology is the use of a shared two-conductor cable for data transmission and the distribution of auxiliary power to the sensors/actuators. A power supply unit which meets the requirements of the AS-Interface transmission method and has an external data decoupling module if required is used for the distribution of auxiliary power. The AS-Interface cable used for the wiring is mechanically coded and hence protected against polarity reversal and can be easily contacted by the insulation piercing method.

Elaborately wired control cables in the control cabinet and marshalling racks can be replaced by AS-Interface.

The AS-Interface cable can be connected to any points thanks to a specially developed cable and connection by the insulation piercing method.

With this concept you become extremely flexible and achieve high savings.

**Application**

**I/O data exchange**

The AS-i master transmits automatically the inputs and outputs between the control system and the digital and analog AS-Interface slaves.

Slave diagnostics information is forwarded to the control system when required.

AS-Interface masters according to the AS-Interface Specification V2.1 or V3.0 support integrated analog value processing. This means that data exchange with analog AS-Interface slaves is just as easy as with digital slaves.

**Command interface**

In addition to I/O data exchange with binary and analog AS-Interface slaves the AS-Interface masters provide a number of other functions through the command interface.

Hence it is possible, for example, for slave addresses to be issued, parameter values transferred or configuration information read out from user programs.

Overview

To implement communication, a system installation has the following main components:

- Master interface modules for central control units such as SIMATIC S7, ET 200 distributed peripherals, or routers from PROFINET to AS-Interface
- Power supply units, if required in combination with a data decoupling module for the power supply to the slaves
- AS-Interface shaped cables

System components

- Network components such as repeaters and extension plugs (cannot be used for AS-i Power24V)
- Modules for connection of standard sensors/actuators
- Actuators and sensors with integrated AS-i slave
- Safety modules for transmitting safety-oriented data through AS-Interface
- Addressing units for setting the slave addresses during commissioning

Example of a configuration with the system components

Features

- 200 m with extension plug
- 300 m with two repeaters in series connection
- 600 m with extension plugs and two repeaters connected in parallel
- Larger cable lengths are also possible when additional repeaters are connected in parallel

- Maximum cycle time
  - 5 ms in full expansion with standard addresses
  - 10 ms in full expansion with A/B addresses, profile-specific for Spec 3.0 slaves

- Number of stations per AS-Interface line
  - 31 slaves acc. to AS-Interface Spec. V2.0
  - 62 slaves (A/B technology) acc. to AS-Interface Spec. V2.1 and V3.0
  - Integrated analog value transmission

- Number of binary sensors and actuators
  - Max. 124 DI/124 DO according to Spec. V2.0
  - Max. 248 DI/186 DO according to Spec. V2.1
  - Max. 496 DI/496 DO according to Spec. V3.0

- Access control
  - Cyclic polling master/slave procedure
  - Cyclic data acceptance from host (PLC, PC)

- Error safeguard
  - Identification and repetition of faulty message frames
# Overview

## Scope of the AS-Interface specification

<table>

<tr>
<td>Version 3.0</td>
<td>62</td>
<td>62</td>
<td>31</td>
</tr>
</tbody>
</table>

- **Version 2.0**: AS-Interface Specification 2.0 describes a fieldbus system with an AS-i master and up to 31 AS-i slaves.
- **Version 2.1**: Each AS-i slave has up to 4 digital inputs and 4 digital outputs.
- **Version 3.0**: With full expansion, the complete transmission of all input/output data requires max. 5 ms cycle time.

## Basic data of AS-Interface Specification 2.0

- AS-Interface Specification 2.0 describes a fieldbus system with an AS-i master and up to 31 AS-i slaves.
- Each AS-i slave has up to 4 digital inputs and 4 digital outputs.
- With full expansion, the complete transmission of all input/output data requires max. 5 ms cycle time.

## Expansions of AS-Interface Specification 2.1

AS-Interface Specification 2.1 enables the number of network stations to be doubled from 31 to 62 as follows:

- The standard slaves continue to occupy one AS-i address (1...31).
- Slaves with extended addressing divide an address into an A address (1A...31A) and a B address (1B...31B). Up to 62 A/B slaves can be connected accordingly to one AS-Interface network.
- Mixed operation of standard slaves and A/B slaves is possible without difficulty. The AS-i master identifies automatically which type of slave is connected. No special adjustments are required of the user.

## Expansions of AS-Interface Specification 3.0

- AS-Interface Specification 3.0 enables the connection of nearly 1000 digital inputs/outputs (profile S-7.A.A: 8DI/8DO as A/B slave).
- New profiles have also enabled the option of expanded addressing for analog slaves.
- Acceleration of analog value transmission through “Fast Analog Profile”.
- Variable use of analog modules: Optional parameterization of resolution (12/14 bit) and 1- and 2-channel capability.
- Asynchronous serial protocol 100 baud or 50 baud, bidirectional.

Another function of the AS-Interface Specification V2.1 is the integrated analog value transmission function. Access to both analog values and digital values is possible without the need for any special function blocks.

### AS-Interface specification

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Version 2.1</td>
<td>CP 243-2 (S7-200)</td>
</tr>
<tr>
<td>Version 3.0</td>
<td>CP 343-2, 343-2P (S7-300 / ET 200M), DP/AS-i Link Advanced, DP/AS-i F-Link, CP 343-2P (S7-300 / ET 200M), EP/AS-i Link 20E, IE/AS-i Link PN IO, CM 1243-2 (S7-1200), CM AS-i Master ST for ET 200SP</td>
</tr>
</tbody>
</table>

The AS-Interface specification relevant for the respective slave is noted in the "Selection and ordering data". For the exact slave profile see AS-Interface system manual.

### Communication cycle

<table>
<thead>
<tr>
<th>AS-Interface specification</th>
<th>Maximum cycle time (digital signals)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version 2.0</td>
<td>5 ms</td>
</tr>
<tr>
<td>Version 2.1</td>
<td>5 ms with 31 slaves</td>
</tr>
<tr>
<td></td>
<td>10 ms with 62 slaves</td>
</tr>
<tr>
<td>Version 3.0</td>
<td>5 ms with 31 slaves</td>
</tr>
<tr>
<td></td>
<td>10 ms with 62 slaves, supplementary,</td>
</tr>
<tr>
<td></td>
<td>up to 20 ms with A/B slaves using 4DI/4DO,</td>
</tr>
<tr>
<td></td>
<td>up to 40 ms with A/B slaves using 8DI/8DO</td>
</tr>
</tbody>
</table>

Each address is queried in max. 5 ms cycle time. If two A/B slaves are operated on one basic address (e.g. 12A and 12B), a maximum 10 ms will be required for updating the data of both slaves.

### More information

#### AS-Interface system manual

A print version of the AS-Interface system manual is also available under the following order number.

- German 3RK2 703-3AB02-1AA1
- English 3RK2 703-3BB02-1AA1
Communication overview

**Introduction**

IO-Link is an open communication standard for sensors and actuators - defined by the Profibus User Organization (PNO). IO-Link technology is based on the point-to-point connection of sensors and actuators to the control system.

**Benefits**

**Engineering**
- Standardized, open system for greater flexibility (non-Siemens IO-Link devices can be integrated in engineering)
- Uniform, transparent configuring and programming through integrated engineering (SIMATIC STEP 7)
- Unassigned SIMATIC function blocks for easy parameterization, diagnostics and read-out of measured values
- Efficient engineering thanks to pre-integration into SIMATIC HMI
- Low error rate in CAD circuit diagram design as a result of reduced control current wiring

**Installation and commissioning**
- Faster assembly with minimized error rate as a result of reduced control current wiring
- Less space required in the control cabinet
- Low-cost circuitry where there are several feeders by making full use of existing components

**Operation and maintenance**
- High transparency in the system right down to field level and integration into power management systems
- Reduction in downtimes and maintenance times thanks to system-wide diagnostics and faster fault correction
- Support of predictive maintenance
- Shorter changeover times, even for field devices, by means of parameter and recipe management

**Application**

IO-Link can be used in the following main applications:
- Easy connection of complex IO-Link sensors/actuators with a large number of parameters and diagnostic data to the control system
- Replacement of sensor boxes for connecting binary sensors with the IO-Link input modules optimized in terms of cabling
- Optimized cable connection of switching devices to the control system
- Simple transmission of energy values from the device to the control system for integration into a user program or power management

In these cases, all the diagnostics data are transmitted to the higher-level control system through IO-Link. The parameter settings can be changed during operation. Central data storage means that it is possible to exchange an IO-Link sensor/actuator without a PC or programming device.

**Integration in STEP 7**

Integration of the device configuration in the STEP 7 environment guarantees:
- Quick and easy engineering
- Consistent data storage
- Quick localization and rectification of faults
To implement communication, a system installation has the following main components:

- An IO-Link master
- Several IO-Link devices, usually sensors (RFID systems), actuators or combinations of these
- A standard 3-wire sensor/actuator cable
Compatibility of IO-Link

IO-Link guarantees compatibility between IO-Link-capable modules and standard modules as follows:

- IO-Link sensors can be operated both on IO-Link modules (masters) and standard input modules.
- IO-Link sensors/actuators as well as today’s standard sensors/actuators can be used on IO-Link masters.
- If conventional components are used in the IO-Link system, then of course only the standard functions are available at this point.

Analog signals

Another advantage of IO-Link technology is that analog signals are digitized already in the IO-Link sensor itself and are digitally transmitted by the IO-Link communication. As the result, faults are prevented and there is no extra cost for cable shielding.

Enhanced through IO-Link input modules

IO-Link compatibility also permits connection of standard sensors/actuators, i.e., conventional sensors/actuators can also be connected to IO-Link. This is particularly effective with the IO-Link input modules, which allow several sensors to be connected at one time via a cable to the controller.

Load feeders and motor starters

Through IO-Link it is possible to control not only sensors but also actuators in the form of load feeders and motor starters.

Grouping of motor starters

The SIRIUS controls allow four starters to be combined to form a group.

Connection of a motor starter group made up of three 3RA64 direct-on-line starters and a 3RA65 reversing starter

In this way up to 16 starters can be operated on a single IO-Link master. This leads to a reduction in the installation space and control wiring required.
**Overload and monitoring relays**

By combining overload/monitoring relays with IO-Link it is now possible to send data that has already been recorded and evaluated in the monitoring relays directly to the controller. This avoids the use of duplicated sensors.

---

**Possibilities for connecting overload relays to IO-Link or in the conventional way**

**Wireless communication**

Using an upstream IWLAN client module, such as SCALANCE W746-1PRO, allows IO-Link to be integrated into the PROFINET world via a distributed I/O. Possible uses include acting as an alternative to fault-prone cable carrier or collector wire technology. The individual diagnostics options offered by the various IO-Link devices provide greater transparency for the production process. Just like the parameter data for a device, these diagnostics data can be evaluated remotely using the possibilities offered by SIMATIC. This supports remote maintenance down to the lowest level in the field.
**IO-Link**

**Introduction**

**System components**

### IO-Link components

#### IO-Link master, software, cables

**Masters**
- IO-Link master modules for ET 200SP
  - CM 4x IO-Link
- IO-Link master modules for ET 200S
  - IO-Link 4SI electronic module
  - SIRIUS 4SI electronic modules
  - IO-Link master modules for ET 200eco PN

#### Software

**STEP 7 PCT**
- Engineering software for configuring the IO-Link master modules for ET 200SP, ET 200S and ET 200eco
  - Available as a stand-alone version or integrated into STEP 7 (Version 5.5 SP1 or later)
  - Retrieving parameter and diagnostics data from the IO-Link devices connected to the master
  - Monitoring of the process image of the IO-Link devices
  - Open interface for importing further IODDs
  - Freely available for download from Industry Online Support

**WinCC flexible**
- Easy integration of IO-Link devices into the user program by using ready-made WinCC flexible templates
  - Freely available for download from Industry Online Support

#### IO-Link Call function block

**STEP 7 function block**
- STEP 7 function block for easy acyclical data exchange in the user program
- Freely available for download from Industry Online Support

#### WinCC flexible template project

**Easy integration of IO-Link devices into the user program by using ready-made WinCC flexible templates**
- Freely available for download from Industry Online Support

#### IODD files

**IO-Link Device Description (IODD) files provide the device description for IO-Link**
- Comprehensive IODD catalog of SIEMENS IO-Link devices
- Freely available for download from Industry Online Support

#### Cable

**3-wire standard cable**

### IO-Link devices (continued)

#### IO-Link RFID systems

**SIMATIC RF200 RFID system in the HF range**
- SIMATIC RF210R, SIMATIC RF220R, SIMATIC RF260R products
- Simple identification tasks (read-only), such as reading an ID number
- No RFID-specific programming, ideal for those new to RFID
- Simple connection via master modules for IO-Link, such as SIMATIC ET 200S and ET 200eco
- Use with the tried and tested ISO 15693 transponders (MOBY D)

#### Switching with IO-Link

**Contactors and contactor assemblies**
- Power contactors for switching motors
  - SIRIUS 3RT2 contactors, 3-pole, up to 18.5 kW
  - Contactor assemblies
  - SIRIUS 3RA23 reversing contactor assemblies
  - SIRIUS 3RA24 contactor assemblies for wye-delta starting
  - SIRIUS 3RA27 function modules for IO-Link
  - For direct-on-line starters, reversing starters and wye-delta starters

See chapter 2

**Motor starters for use in the control cabinet**
- SIRIUS 3RA6 compact starters
  - 3RA64 direct-on-line starters
  - 3RA65 reversing starters
  - Infeed systems for 3RA6

See chapter 4

#### Contactors with IO-Link

**Overload relays**
- SIRIUS 3RB24 solid-state overload relays for IO-Link
  - Evaluation module
  - Current measuring modules from 0.3 to 630 A
  - Controlling direct-on-line, reversing and star-delta starters via IO-Link in conjunction with contactors
  - Full motor protection
  - Diagnostics and current value transmission via IO-Link

See chapter 3

**Monitoring with IO-Link**

**Monitoring relays**
- SIRIUS 3UG48 monitoring relays for IO-Link
  - Monitoring voltage, current, power, speed or p.f. according to device design
  - ON-delay and tripping delay time can be adjusted

See chapter 11

- SIRIUS 3RS14, 3RS15 temperature monitoring relays for IO-Link
  - Temperature monitoring with connected sensors
  - Two limit values, can be adjusted separately

See chapter 11

- SIRIUS 3RR24 monitoring relays for IO-Link
  - Monitoring of current, phase failure, open circuit and phase sequence
  - Designed for mounting on 3RT2 contactors

See chapter 2

---

Introduction

IO-Link specification

Overview

Principles of the IO-Link specification

According to the IO-Link specification, communication functions as follows:

- Transmission takes place via an unshielded three-wire cable no more than 20 m long, of the kind normally used for standard sensors.
- Analog values which have already been digitized are transmitted in the form of message frames, which may correspond to +/- 10 V or 4 to 20 mA. Digital communication from 0 to 24 V on the so-called C/Q cable.
- Most of the values transmitted are measured values from the sensors which include the units.
- The sensors and actuators are described by the IO-Link Device Description (IODD).
- While the IO-Link specification permits an infinite number of ports, an IO-Link master currently only supports four ports. Only one IO-Link device (slave) can be connected to each port (point-to-point connection).
- Transmission parameters between IO-Link master and the devices are as follows:
  - via COM1: 4 800 bps
  - via COM2: 38 400 bps
  - via COM3: 230 400 bps
- The average cycle time is 2 ms for the reading/writing of 16 data bits at a transmission rate of 38 400 bps.

IO-Link protocol

For the dialog between device and master, IO-Link uses a standard protocol, the standard asynchronous communication interface (UART) in “semi-duplex” mode. The IO-Link protocol supports both the Standard IO mode (SIO) and the IO-Link communication mode (COM).

Data types

In the IO-Link specification a distinction is made between the following data types:

- Process data
  - The process data of the devices are transmitted cyclically in a data frame, provided the process data width does not exceed 2 bytes. In the case of larger process data widths up to 32 bytes, parts are transmitted one after the other in several cycles. As of Version V1.1 of the specification, up to 32 bytes of process data can be transferred in a single cycle.

Service data (SD)

With the aid of the service data, parameter values or device statuses can be read out. It is also possible to write the parameter values or transmit commands via the service data. Service data are always exchanged acyclically and in response to an inquiry from the IO-Link master.

Events

Via events it is possible to transmit device events or statuses such as contamination, overheating, short circuits etc., from the device via the IO-Link master to the PLC or to visualize them. The events are sent on the initiative of the devices via the “event flag”, which the master evaluates. The master itself can also generate events.

Three categories of event are defined:

- Error signals (errors)
- Maintenance data (warnings)
- Device functions (notifications)

M-sequence (message frames)

Parameter data, events and process data can be transmitted either in an M-sequence (message frame) or in separate M-sequences (message frame).

Data storage concept

As of Specification V1.1, a data storage concept has been created for IO-Link. In this concept, the IO-Link device initiates the storage of its data on a higher-level parameter server. In the event that a device is replaced, the parameter server can restore the original parameterization. It is therefore possible to replace the devices without re-parameterization.

The IO-Link master can contain the parameter server. The parameter server can also be implemented centrally in the PLC or in a system server. In this case the IO-link master passes on the corresponding information.

IO-Link master

The IO-Link master is the interface to higher-level control systems. The IO-Link master presents itself as a normal fieldbus node, and is integrated into the appropriate network configurator via the relevant device description (e.g. GSD, FDCML, EDS etc.).

IO-Link Device Description (IODD)

The IO-Link Device Description (IODD) has been defined to provide a full, transparent description of system characteristics as far as the IO-Link device. It is based on the open XML standard. The IODD contains information on communication characteristics, device parameters, identification, process and diagnostics data, and is supplied by the manufacturer. The design of the IODD is the same for all devices from all manufacturers, and is always presented in the same way by the IODD Interpreter Tools. This therefore ensures that the handling is the same for all IO-Link devices, whatever the manufacturer.

New in IO-Link specification 1.1

The IO-Link specification is currently available in Version 1.1, and is currently standardized as IEC 61131-9 (CDV). Specification 1.1 offers the following new features compared with the previous specification 1.0:

- New variable M-sequences allow transmission of up to 32 bytes of process or service data in a single cycle.
- Data storage concept
