

Simple parameterization: SIRIUS 3SK

There are lots of **simple local safety applications**

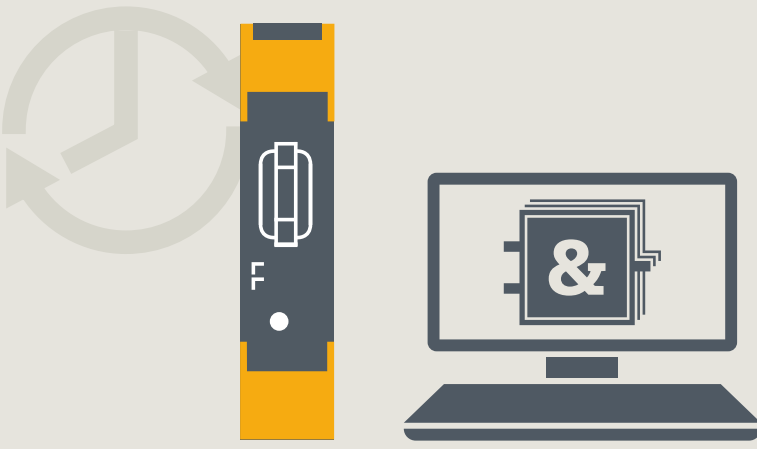

With SIRIUS safety relays, many of these can be parameterized with **a single operation** on the device itself

Or:

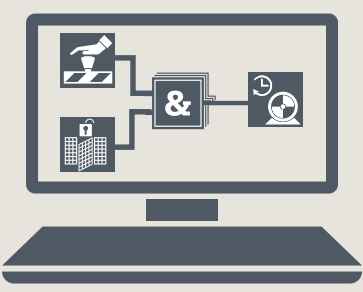

with simple PC software.

With no need for any programming knowledge!

Safety functions in the form of **certified modules** can be parameterized simply by **dragging and dropping**

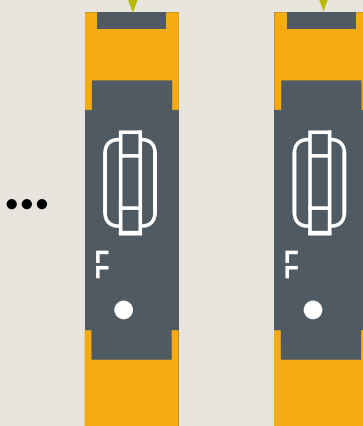

Equally as simple:

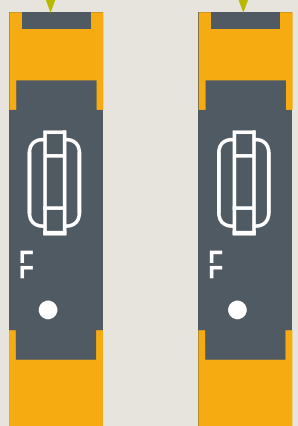

The **linking** of functions

Including for **independent output functions**.
Or for **time-delayed disconnection**

Once the parameters of the configurations have been set, they can then be transferred to **any number of devices**

Easily. Intuitively. Without error

Safety is a **SIRIUS** business
